Do we need an aggregation layer switch

Overview

As the aggregation point of access switches, the aggregation switch is required with the ability to process the access layer information and submits it to the upstream chain of the core layer. The aggregation layer serves as the convergence point for multiple access layer switches and is responsible for handling all. Knowing the roles of core, aggregation, and access switches in contemporary network topology becomes essential to create effective and scalable networks. This article looks at what each such tool does, compares how they differ from each other, and offers suggestions as to what sort of network each. An aggregate switch is a high-capacity network switch that consolidates connections from multiple access switches, acting as a central point for managing network traffic and providing enhanced bandwidth capabilities. It is essential for larger networks requiring efficient data flow.
