Integrated Modular Data Center

Overview

Using prefabricated modules, these centers are operational in weeks rather than months, unlike traditional ones.

Key Takeaways

Integrated Modular Data Centers are pre-engineered, factory-tested data center units that combine IT infrastructure, power, and cooling systems for rapid, scalable, and efficient deployment.

Overview

An Integrated Modular Data Center (IMDC) is a complete or partial data center system that is engineered, assembled, and tested off-site before being delivered to its final location. Unlike traditional “brick-and-mortar” data centers, IMDCs compress construction schedules, improve quality control, and allow incremental capacity growth. They can range from micro-modules of 30 kW to multi-megawatt prefabricated rooms or containerized units, supporting enterprise, edge, cloud, and hyperscale applications.

Key Features

Factory Integration: Modules are pre-assembled and tested in controlled environments, reducing on-site labor and logistical complexity. Scalability: IMDCs allow stepwise expansion, enabling organizations to add capacity as demand grows without major construction. Rapid Deployment: Prefabricated modules can be transported by road, rail, or sea, significantly shortening deployment timelines—sometimes by over 40% compared to conventional builds.

Integrated Power and Cooling: Many IMDCs include on-site power generation, UPS systems, and advanced cooling solutions, ensuring high reliability and energy efficiency for high-density workloads. Operational Flexibility: Modular designs support hybrid, edge, and AI-driven applications, with the ability to replicate designs across multiple locations. Quality and Risk Management: Factory-controlled assembly ensures consistent quality, reduces construction risks, and provides predictable costs.

ApplicationsIMDCs are widely used in: Enterprise and colocation data centers for rapid capacity expansion. Edge computing to support low-latency applications near end-users. Cloud and hyperscale deployments, including AI and LLM workloads, where high-density power and cooling are critical.

Remote or austere environments, where traditional construction is impractical.

Leading Providers

Vertiv: Offers scalable, prefabricated modules with advanced power and cooling solutions.

AB

B: Provides pre-engineered eHouses and skid-mounted units with integrated electrification and modular power systems. Siemens Energy & Eaton: Deliver IMDCs with integrated on-site power generation, reducing reliance on external grids and cutting deployment times by up to two years.

Blade

Room, Durata, STULZ, Northstar: Specialize in energy-efficient, rapidly deployable modular units for enterprise, defense, and hyperscale applications.

Benefits

Faster time-to-market: Concurrent off-site module construction and site preparation accelerate deployment. Cost predictability: Factory integration reduces unexpected on-site costs and labor requirements. Energy efficiency: Advanced cooling and power systems lower PUE and operational costs.

Reliability: Redundant power and integrated systems ensure high uptime, often exceeding 99.99% availability. Sustainability: Modular designs support low-carbon power options, including hydrogen-ready and SF6-free systems.

IMD

Cs represent a modern, flexible, and future-ready approach to data center construction, particularly suited for organizations needing rapid deployment, high reliability, and scalable infrastructure for AI, cloud, and edge computing workloads.
